

Tilted Image

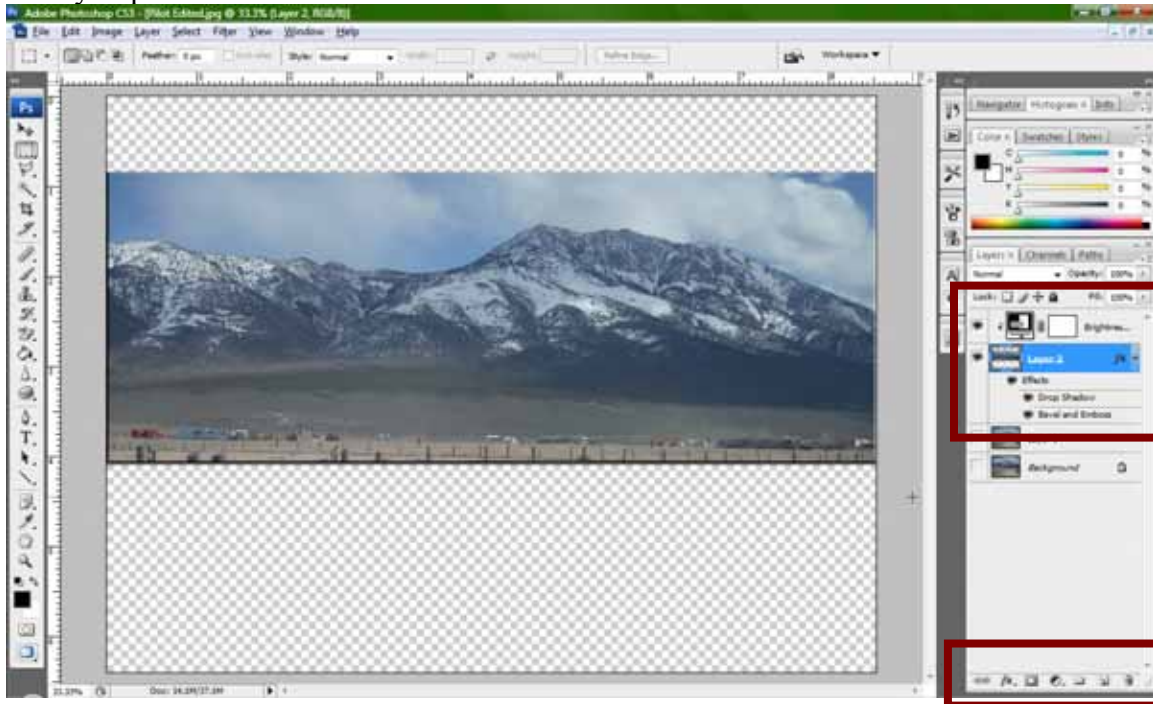

Open your image and make sure to have a copy of it. (ctrl J) Work off the copy!

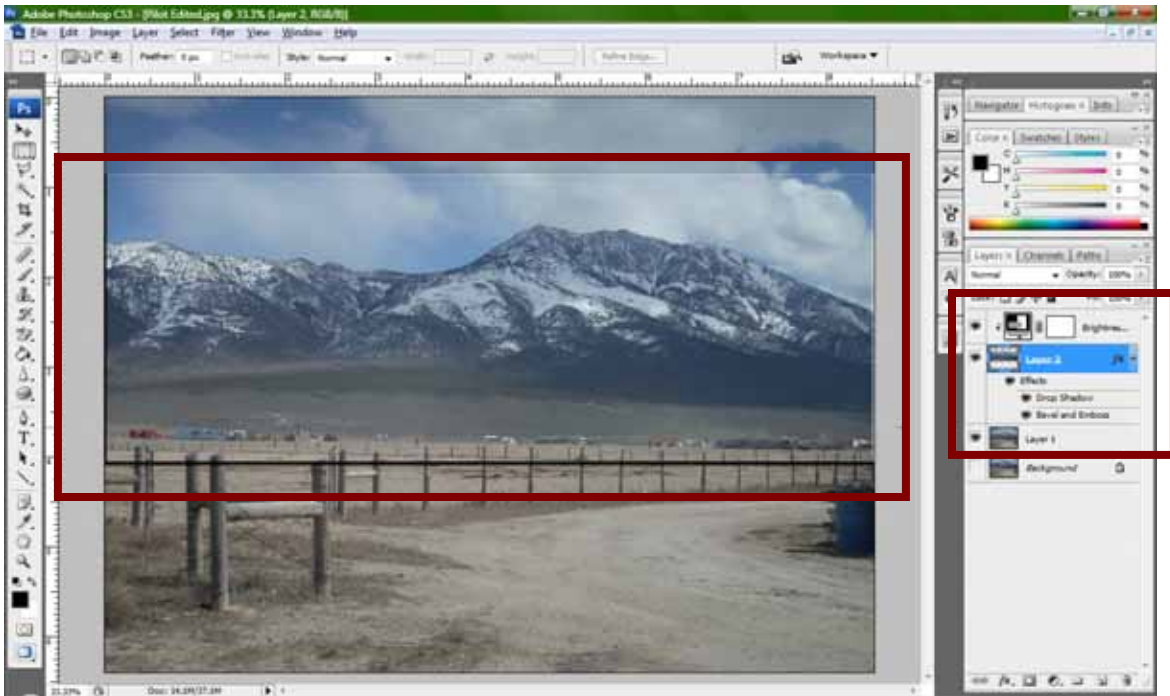

Use the marquee tool and select the focal point of your image. You can decide the shape. (Circle or rectangle)

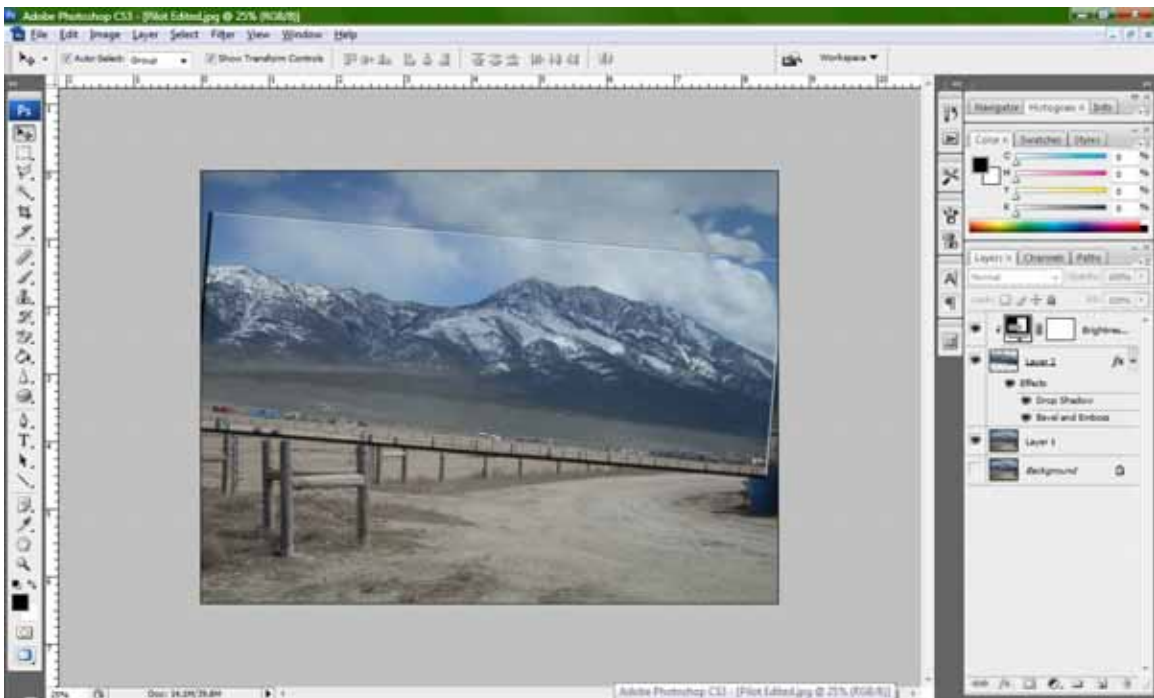

After that press Ctrl C to copy and Ctrl V to paste. A new layer is automatically created once you paste.

Click on the copied layer and make your desired changes. I like to use the *Add a Layer Style and Create a new adjustment layer*. I like to use the bevel tool the most. 😊

Then view the original image along with the copied layer. From there use your transform tool and tilt your image.

This is a great way to add focus and depth to your image.
