

Enhancing Color in Photoshop

1. Open photo in Photoshop.
2. Create a new layer.
3. Now go to Image, Adjustments, Match Color. A new window should pop up.
4. In this new window, in the dropdown box labeled Source select the image that you are editing. In the dropdown box labeled Layer select Layer 1.
5. Now, adjust the color intensity and the fade scrolls for a color changing effect on your image. The luminance doesn't need to be adjusted. It will only darken or lighten your photo.

Also, in the same place (Image, Adjustments), experiment with hue/saturation and selective color. All will give you a different effect and will enhance the color in your photo in a different way.
